

User Acceptance Tests (UAT) - Payment Tracking

Scenario 1: Viewing the Group Payment Tracking Ledger

GIVEN the treasurer wants to track member payments for a specific group,
WHEN they navigate to the Payment Tracking page,
THEN they should see a list of all group members with their respective payment statuses, allowing them to dynamically update a member's status.

Scenario 2: Searching for Members by Name or Email

GIVEN the treasurer wants to change a specific member's status but the account ledger list is too long,
WHEN they type the member's name or email address into the available search bar,
THEN the ledger table should instantly filter to display only the matching user records.

Scenario 3: Filtering the Workspace Ledger by Payment Status

GIVEN the treasurer wants to isolate members who have paid, are pending, missed payments, or are flagged,
WHEN they apply a specific status filter from the dropdown menu,
THEN only the members sharing that exact payment status should be listed in the workspace table.

Scenario 4: Real-time Metric Updates on Status Change

GIVEN the treasurer marks a member's administrative status as paid, missed, or flagged,
WHEN the status transition is successfully updated in the ledger,
THEN the real-time indicator cards and completion progress metrics must immediately recalculate to reflect the updated contribution changes.
